Free stocks and futures analysis software that can test your approach to the markets. GenStocks Free Download is a desktop application that can evaluate approximately 2000 stocks per day by applying a sophisticated neural/genetic algorithm to real historical market data. The underlying algorithms can be thought of as collectively providing advanced signal-analysis methodology. GenStocks Crack Free Download - Stocks & Futures Trading Software GenStocks is a desktop application that can evaluate approximately 2000 stocks per day by applying a sophisticated neural/genetic algorithm to real historical market data. The underlying algorithms can be thought of as collectively providing advanced signal-analysis methodology. Via the neural/genetic approach, distinct patterns in a stock's past performance are quantified as "measures," with a "weight" assigned to each of these measures. GenStocks will then generate a composite "score" for each stock, based on the weighted sum into a specified past. Then genetic evolution is applied to all possible sortings of the 2000-some competing stocks. GenStocks thus creates a sorted list, on user demand, that shows the most reasonable ranking as regards projection of profit. GenStocks is an excellent addition to an investor's arsenal of analysis tools. The software includes daily charts, daily updates, and back-testing features. TECHNICAL DETAILS Name: GenStocks - Stock Analysis Software Your Software Platform: Windows Vista Home Premium 32 bit or higher Download Size: 3.3 MB Language: English Software License: Freeware Download type: .exe Version: 1.0 Release Date: Jan 4, 2010 URL: The application does a few things that I want, but there's no help (neither a manual nor a website). It runs but it's completely useless, it can only display lists, but there's no other way to change them. And there is no way to create/edit the lists that are displayed (like adding/removing stocks). Also, there's no manual that explains how to use the application. You can change some parameters in the configuration files, but you'll be able to make some changes only if you've the knowledge of the application code. Just make your own list of stocks and set the rest of the parameters as you wish. Also, be aware that each list has a sorting logic by current day, stock price and volume, among others. After having installed the application, you can go to: Start /

The first version of GenStocks is a research tool. The system includes the functionality to: 1) Run the neural network repeatedly, in order to assess the effects of random variation in the data 2) Generate a sorted list of stocks, showing which stocks perform best 3) Trade the stocks on the basis of the sorted list 4) Evaluate the sorted list against a set of benchmarks It is primarily designed for work in the following areas: 1) Stock traders 2) Fundamental analysts 3) All markets Using an Artificial Neural Network (ANN) method, GenStocks performs a sophisticated optimization procedure in an attempt to determine a set of optimal stocks. These optimal stocks correspond to those which best predict the performance of a selected set of benchmark stocks over time, based on the performance of that set of benchmark stocks over time. In short, a neural network is used to analyze historical market data, in order to derive stock market signals. The optimal set of stocks, the top performing stocks, are then produced as a function of the neural network analysis. This analysis is run separately for the performance of each benchmark stock. A weighting factor is assigned to each stock's performance, based on the relative performance of each benchmark stock, and the neural network analysis is run again. This process is repeated until a predetermined number of optimal stocks have been produced. Explanation The "GENES" in "GenStocks" stands for "genetic algorithm." This is a complex software approach that involves combining the best attributes of Artificial Intelligence and the natural processes of genetic evolution. The method of neural networks is an extension of the method of adaptive resonance theory, a natural process that occurs in the nervous system. The resemblance between these two processes can be taken as evidence of the innate nature of intelligence. In the context of computer application, the neural network method combines the best aspects of artificial intelligence and the processes of natural evolution, and can be thought of as a sophisticated form of adaptive resonance theory. The neural network method processes data by simulating a simulated nervous system, that learns by trial and error. The Genetic algorithm is a method of evolution, that produces an optimal set of solutions to a problem. It is based on two processes: 1) Choosing which solutions are the "best" 2) Repeating those best solutions GenStocks is based on the premise that a set of stocks that provide a strong signal may be more likely

What's New In GenStocks?

For each time period selected, GenStocks examines the historical price action of each stock and produces a "Score" for each, based on a specific algorithm. A genetic evolution algorithm then sorts the 2000+ stocks into 20 or so categories. The user can sort the stocks in both the number of days and the price range in which they are assessed. Upon entry of the date and range, all stocks are screened for those stocks that will be in each category based on the sort specified. Then all stocks that pass are marked for the calculation of a "Score" based on an established algorithm. A "Score" is assigned to each stock based on the combination of stocks in the same category and the total number of stocks in each category. The result is a list of the stocks with the highest "Score" for each sort specified. Stocks are ranked based on their Score. A score is also calculated for each period. The period Score, as well as the individual daily Score, may be saved for future reference and use.
