Adobe has just released a new version of Photoshop 2018 that introduces a host of new and exciting features. With new and improved versions of all Photoshop features, you'll work faster, enhance your images more easily, and adjust color more accurately. The matting engine in Photoshop now supports both on-image masks and on-image tone masks. For example, if you apply a layer mask that indicates a spot of background color, the masked portion of the image will retain only the background color, instead of being replaced by white or black. You can make adjustments to color, exposure, levels, and brightness in a single step. With the Adjustments panels, you can dim the highlights and reduce background noise while brightening the desired areas in your image. And when you use the Shadows/Highlights panel, you can make areas that are too dark or bright more realistic. - Every tool in Photoshop lets you work with an image's layers, making it easier to create new elements, refine the appearance of existing elements, or clone any portion of any layer that's just not quite right. You can add a variety of special effects to an image, such as stars, gradients, and text overlays. They can be added individually or combined to make them more complex or subtle, as well as animated and individualized on images, shapes, and text. Many image creation and editing tasks can be done with only one click. For example, you can crop, resize, and sharpen a photo with a few mouse clicks. And when you import a photograph into Photoshop, the program creates a series of smart masks to automatically adjust the edge of the image. You can also export your image when
